TrussBRACE

Roof Truss Support

Increases Safety

TrussBRACE reduces climbing and unnatural body position because they are easily installed by walking along the bottom chord of the truss.

Saves Lumber, Time & Money

Because the TrussBRACE system provides both lateral and diagonal restraint in one application, there is no need to remove temporary braces before sheathing. The design allows for easy web member bracing and roof sheathing application.

Improves Efficiency

TrussBRACE eliminates the need for time-consuming installation of temporary top chord bracing required by other traditional bracing options.

Adds Stability

Comparison testing shows that a TrussBRACE system is more than 40% stronger than a BCSI system. The angled leg provides additional stiffness to firmly support and space each truss.
